AI Traffic Monitoring Report

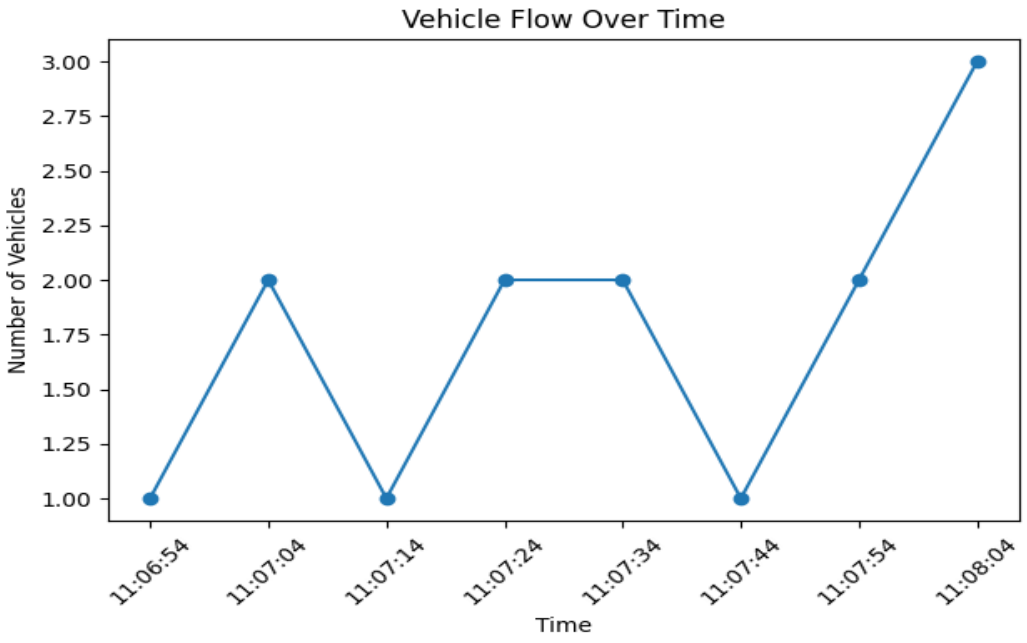
Summary

Total Vehicles Detected: 14
Average Vehicles per Interval: 1.75
Peak Traffic Count: 3

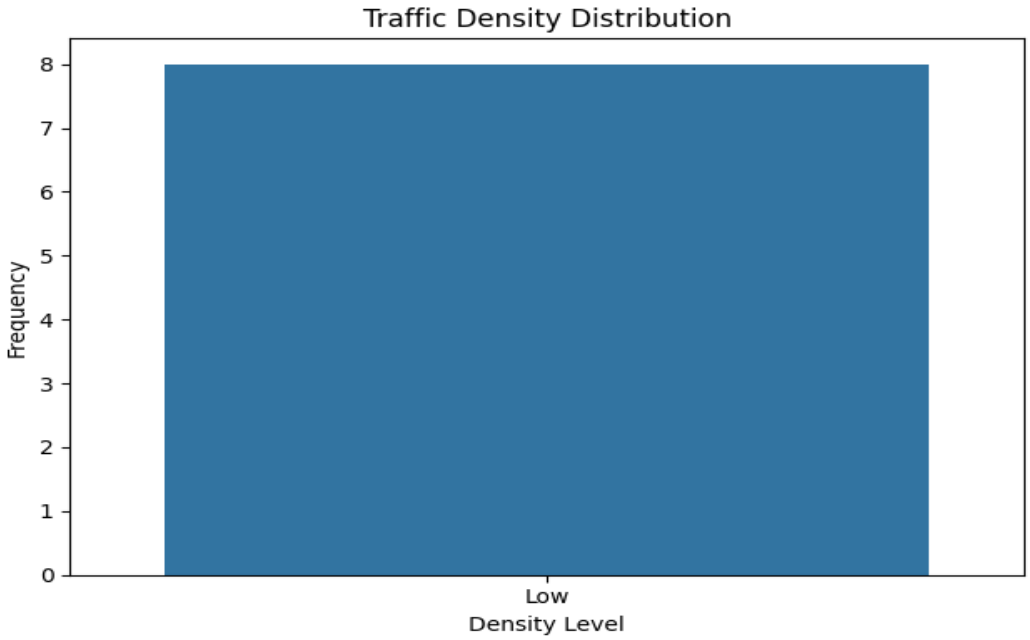
AI-Based Insights

Most Frequent Density Level: Low
Maximum Signal Time Suggested: 10 seconds
Traffic Jam Alerts Triggered: 0
Peak Traffic Time: 11:08:04 with 3 vehicles

Vehicle Flow Analysis



Traffic Density Distribution



System Intelligence

The system dynamically analyzes traffic patterns and provides intelligent decision support such as adaptive signal timing, congestion detection, and peak traffic identification. These capabilities demonstrate the transition from simple monitoring to an AI-driven traffic management system.

Conclusion

This report highlights the effectiveness of the AI-based traffic monitoring system in detecting, analyzing, and interpreting traffic conditions. The integration of detection, analytics, and decision-making enables real-time traffic optimization and provides valuable insights for smart city applications.
